Diese Beschreibung gilt für die von Salzburg Netz eingesetzten Smart Meter der Hersteller Kaifa und Honeywell.

1 Physikalische Schnittstelle:

Anschluss: RJ 12 Modular Jack 6P6C
 Konfiguration: Wired M-Bus Master
 Baud-Rate: 2.400

Pin-Nr.	Belegung
1	nicht verwendet
2	nicht verwendet
3	MBUS1 (+)
4	MBUS2 (-)
5	nicht verwendet
6	nicht verwendet

1.1 Stromversorgung:

M-Bus 4 M-Bus-Loads mit insgesamt 6mA und 32V

2 Protokoll-Version:

Version: DLMS / COSEM, IDIS CII

3 Security Standard:

Security Suite: Security Suite 1
 Security Profil: Security profile B laut OMS Standard
 Verschlüsselung: AES128-CBC
 Key: Global Unicast Encryption Key
 Authentication: CMAC (8 Byte trunc)(MAC-Mode AT=5)

4 Kommunikation:

Kom.-Richtung: Push only
 Push-Intervall: 5 Sekunden

5 Datenmodell:

OBIS-Code	Attribut
0-0:1.0.0.255,1	Clock Attribute 1
0-0:1.0.0.255,2	Clock attribute 2
0-0:96.1.0.255	Zählernummer
0-0:42.0.0.255	COSEM logical device name
1-0:32.7.0.255	Spannung L1 (V)
1-0:52.7.0.255	Spannung L2 (V)*
1-0:72.7.0.255	Spannung L3 (V)*
1-0:31.7.0.255	Strom L1 (A)
1-0:51.7.0.255	Strom L2 (A)*
1-0:71.7.0.255	Strom L3 (A)*
1-0:1.7.0.255	Wirkleistung Bezug +P (W)
1-0:2.7.0.255	Wirkleistung Lieferung -P (W)
1-0:1.8.0.255	Wirkenergie Bezug +A (Wh)
1-0:2.8.0.255	Wirkenergie Lieferung -A (Wh)
1-0:3.8.0.255	Blindenergie Bezug +R (varh)
1-0:4.8.0.255	Blindenergie Lieferung -R (varh)

* Werte werden ausschließlich bei Drehstrom-Zählern ausgegeben

Zusätzliche Informationen können dem Kapitel 10.5 des DLMS/COSEM Green Book bzw. dem IDIS package 2 entnommen werden.

Nachfolgende Kapitel sind wesentlich:

- DLMS/COSEM Green Book
 - 10.5.3.4.2 MBUS-DATA service primitives
 - 10.5.3.4.3 MBUS-DATA protocol specification
 - 10.5.4 Identification and addressing scheme
 - 10.5.4.4 Link Layer Address for M-Bus broadcast
 - 10.5.4.5 Transport layer address
 - 10.5.4.6 Application addressing extension – M-Bus wrapper
- IDIS package 2
 - 6.11.3 Security on the Consumer Information Interface
 - 6.11.4 CIP System Title an Error Handling

6.2 Overview M-Bus - Physical Layer

The M-Bus consists of

- The master,
- A number of slaves
- A two-wire connecting cable

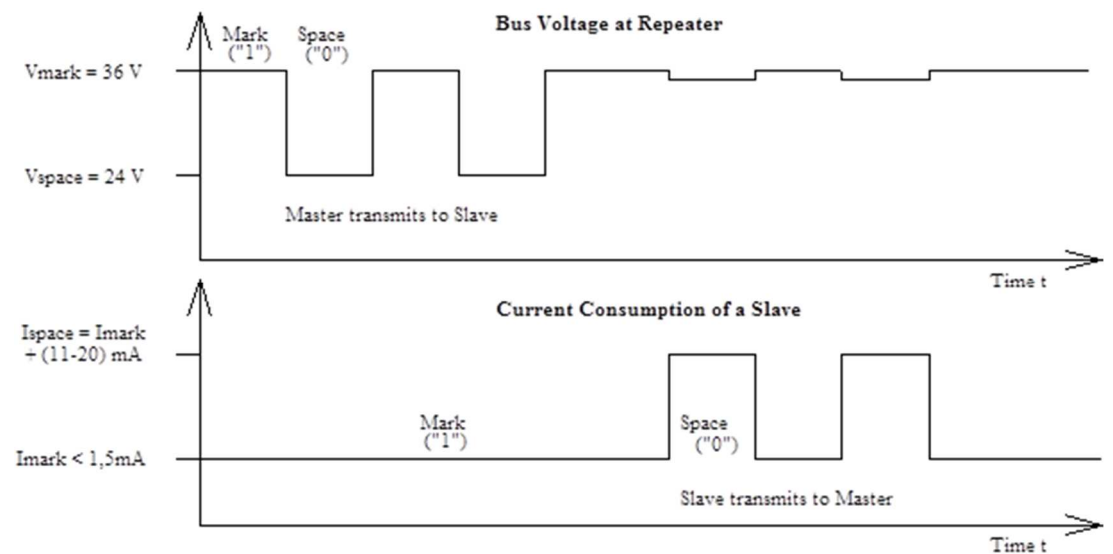

Master to Slave => The transfer of bits from master to slave is accomplished by means of voltage level shifts.

- A logical "1" (Mark) corresponds to a nominal voltage of +36 V
- A logical "0" (Space) reduces the bus voltage by 12 V to a nominal +24 V

Slave to Master => The transfer of bits from slave to master slave is accomplished by means of modulating the current consumption of the slave.

- A logical "1" (Mark) is represented by a constant current of up to 1.5 mA,
- A logical "0" (Space) is represented by an increased current drain requirement by the slave of additional 11-20 mA.

6.3 Overview M-Bus - Data Link Layer

Telegram format - FT 1.2 according to IEC 870-5:

=> The format class FT 1.2 specifies three different telegram formats, which can be recognized by means of special start characters

Single Character

This format consists of a single character, namely the E5h (decimal 229), and serves to acknowledge receipt of transmissions.

Short Frame

This format with a fixed length begins with the start character 10h, and besides the C and A fields includes the check sum (this is made up from the two last mentioned characters), and the stop character 16h.

Long Frame

With the long frame, after the start character 68h, the length field (L field) is first transmitted twice, followed by the start character once again. After this, there follow the function field (C field), the address field (A field) and the control information field (CI field). The L field gives the quantity of the user data inputs plus 3 (for C,A,CI). After the user data inputs, the check sum is transmitted, which is built up over the same area as the length field, and in conclusion the stop character 16h is transmitted.

Control Frame

The control sentence conforms to the long sentence without user data, with an L field from the contents of 3. The check sum is calculated at this point from the fields C, A and CI.

Single Character

E5h

Short Frame

Start 10h

Stop 16h

6.4 Overview M-Bus - Data Link Layer

C Field (Control Field)

The control field specifies the direction of data flow, and is responsible for various additional tasks in both the calling and replying directions.

A Field (Address Field)

The address field serves to address the recipient in the calling direction, and to identify the sender of information in the receiving direction. The size of this field is one Byte, and can therefore take values from 0 to 255.

- Address 0: indicates an unconfigured slave
- Address 1-250: can be allocated to the individual slaves
- Address 251-252: reserved
- Address 253: Network Layer addressing used instead of Data Link Layer addressing
- Address 254: broadcast - all slaves reply with their own addresses
- Address 255: broadcast - none of the slaves reply

CI Field (control information field)

The control information field is already a part of the Application Layer, The control information allows the implementation of a variety of actions in the master or the slaves.

Check Sum

The Check Sum is calculated from the arithmetical sum of the data mentioned above, without taking carry digits into account.

Coding of the Control Field

Bit Number	7	6	5	4	3	2	1	0
Calling Direction	0	1	FCB	FCV	F3	F2	F1	F0
Reply Direction	0	0	ACD	DFC	F3	F2	F1	F0

Control Codes of the M-Bus Protocol (F : FCB-Bit, A : ACD-Bit, D : DFC-Bit)

Name	C Field Binary	C Field Hex.	Telegram	Description
SND_NKE	0100 0000	40	Short Frame	Initialization of Slave
SND_UD	01F1 0011	53/73	Long/Control Frame	Send User Data to Slave
REQ_UD2	01F1 1011	5B/7B	Short Frame	Request for Class 2 Data
REQ_UD1	01F1 1010	5A/7A	Short Frame	Request for Class 1 Data (see 8.1: Alarm Protocol)
RSP_UD	00AD 1000	08/18/28/38	Long/Control Frame	Data Transfer from Slave to Master after Request

6.5 Overview M-Bus – Transport Layer

The M-Bus transport layer allows several application layers to co-exist over the M-Bus lower layers.

These may be:

- the M-Bus dedicated AL
- the DLMS/COSEM AL
- some other AL that may be specified in the future.

The AL used is selected by the Control Information (CI) field of the M-Bus frame.

CI field values

CI	Application
00h-1Fh	DLMS/COSEM M-Bus based TL No M-Bus Data Header is present
20h-4Fh	reserved for DLMS-based applications
50h	application reset
51h	data send (master to slave)
52h	selection of slaves
53h	reserved
54h-58h	reserved for DLMS-based applications
55h-58h	reserved
5Ch	synchronise action
60h	DLMS/COSEM M-Bus based TL Long M-Bus Data Header present, direction master to slave
61h	DLMS/COSEM M-Bus based TL Short M-Bus Data Header present, direction master to slave
62h-6Fh	reserved
70h	slave to master: report of application errors
71h	slave to master: report of alarms
72h	slave to master: 12 byte header followed by variable format data
73h-77h	reserved
78h	slave to master: Variable data format response without header
79h	reserved
7Ah	slave to master: 4 byte header followed by Variable data format response
7Bh	reserved
7Ch	DLMS/COSEM M-Bus based TL Long M-Bus Data Header present, direction slave to master
7Dh	DLMS/COSEM M-Bus based TL Short M-Bus Data Header present, direction slave to master
7Eh-80h	reserved
81h	Reserved for a future CEN-TC294- Radio relaying and application Layer
82h	Reserved for a future CENELEC-TC205 network/application Layer
82h-8Fh	reserved
90h-97h	manufacturer specific (obsolete)
A0h-AFh	manufacturer specific
B0-B7h	manufacturer specific
B8h	set baudrate to 300 baud
B9h	set baudrate to 600 baud
BAh	set baudrate to 1200 baud
BBh	set baudrate to 2400 baud
BCh	set baudrate to 4800 baud
BDh	set baudrate to 9600 baud
BEh	set baudrate to 19200 baud
BFh	set baudrate to 38400 baud
C0h-FFh	reserved

6.6 DLMS/COSEM M-Bus transport layer

DLMS/COSEM AL based CI values

CI _{TL}	Description
0x00-0x1F	No M-Bus Data Header is present ¹
0x60	Long M-Bus Data Header present, direction master to slave
0x61	Short M-Bus Data Header present, direction master to slave
0x7C	Long M-Bus Data Header present, direction slave to master
0x7D	Short M-Bus Data Header present, direction slave to master

¹ In this case, segmentation / reassembly is possible with restrictions.

CI without M-Bus Data Header

b7	b6	b5	b4	b3	b2	b1	b0
0	0	0	FIN	Sequence number			

The values CI_{TL} = 0x00...0x1F indicate that no M-Bus Data Header is present. In this case, the TL can provide segmentation and reassembly

- Bit 4 (FIN) indicates that the Data field of the TPDU carries either one part of an xDLMS APDU or the complete APDU.
- Bits 3 to 0 are used for sequence numbering. The rollover of the sequence numbers is permitted, meaning that when the sequence number reaches the value 1111 and there are segments remaining to be sent, the next segment sequence number will take the value 0000.

TPDU with no M-Bus Data Header, Data without segmentation

TPDU with no M-Bus Data Header, Data with segmentation, first segment

TPDU with no M-Bus Data Header, Data with segmentation, one segment

TPDU with no M-Bus Data Header, Data with segmentation, last segment

TPDU with short M-Bus Data Header, Data without segmentation

TPDU with long M-Bus Data Header, Data without segmentation

6.7 Example M-Bus frame
